

**Pharmacotherapy of Diabetes Mellitus**  
**KHOI NGUYEN LAM**

	TYPE 1		TYPE 2	
Epidemiology	- 10% of DM - <1% of population		- 90% of DM - 8.7% of population > 20 yoa	
Disease State Definition	Diabetes mellitus is a group of metabolic diseases characterized by hyperglycemia resulting from defects in insulin secretion, insulin action, or both.  Beta cell destruction (immune mediated or idiopathic) → complete insulin deficiency  GESTATIONAL :: glucose intolerance while pregnant (NOT pregnant woman with DM)		body is insulin RESISTANT (w/or w/o insulin deficient  screening every 3 years > 45 yoa	
Patho-physiology	- Autoimmune destruction of the beta cells of the pancreas (immunity against islet and beta cells)		- Abnormalities that result in the resistance to insulin action (ie apple built frame)	
Clinical Presentation	- Classical (polyuria, polydipsia, unexplained wt loss) - Hyperglycemia (polyuria, polydipsia, wt loss, polyphagia, blurred vision) - Complications <ul style="list-style-type: none"><li>○ Vascular Diseases<ul style="list-style-type: none"><li>▪ Macrovascular<ul style="list-style-type: none"><li>• accelerated coronary atherosclerosis</li><li>• cerebrovascular atherosclerosis</li><li>• peripheral vascular disease</li><li>• MI</li><li>• stroke</li></ul></li><li>▪ Microvascular<ul style="list-style-type: none"><li>• Retinopathy</li><li>• Nephropathy</li></ul></li></ul></li><li>○ Neuropathic Conditions<ul style="list-style-type: none"><li>▪ Sensorimotor neuropathy</li></ul></li><li>○ Autonomic neuropathy<ul style="list-style-type: none"><li>▪ Gastroparesis</li><li>▪ diabetic diarrhea</li><li>▪ neurogenic bladder</li><li>▪ impotence in men</li><li>▪ impaired cardiovascular reflexes</li></ul></li><li>○ Mixed Vascular and Neuropathic Disease<ul style="list-style-type: none"><li>▪ Leg ulcers, foot ulcers</li></ul></li></ul>			
Risk Factors	- certain HLA types - Islet cell antibodies present - idiopathic		- Family Hx - Metabolic syndrome <ul style="list-style-type: none"><li>○ &gt;40” XY; &gt;35” XX</li><li>○ TG &gt; 150</li><li>○ HDL &lt; 40 XY; &lt;50 XX</li><li>○ BP &gt; 130/&gt;85</li><li>○ FBG &gt; 110</li></ul>	
Diagnosis (FPG is preferred because of ease and cost)	Stage	Fasting Plasma Glucose (FPG)	Casual Plasma Glucose	Oral Glucose Tolerance
	Diabetes	≥ 126	Sx + ≥ 200	2hr plasma ≥ 200
	Impaired Glucose Homeostasis	110 – 126	-	140-200
	Normal	≤ 110	-	< 140

<b>Desired Therapeutic Outcomes*</b>  <b>*Reference of Guidelines Used</b>	- tight control decreases progression of complications by 70% (Diabetes Control and Complications Trial, United Kingdom Prospective Diabetes Study) - (xxx) American College of Endocrinology and the American Association of Clinical Endocrinologists 2001		
		Goal	Normal
	PrePrandial	90 – 130 (< 110)	< 110
	PostPrandial	< 180 (< 140)	< 140
	HS glucose	110 – 150	< 120
	A1c	< 7% (< 6.5%)	4-6%
	Blood Pressure	< 130/80	
	LDL	< 100	
	TG	< 150	
<b>Treatment Options**</b>  <b>(Non-drug and Drug Therapy – include all therapeutic classes/agents available and preferences per treatment guidelines)</b>  <b>**See Treatment Options Table</b>	Insulin, Diet + exercise		Diet + exercise, oral agents, insulin  Exercise (150min/wk moderate intensity aerobic physical activity, 90min/wk vigorous aerobic exercise)  Drugs: - Secretagogues - Sulfonylureas (Glipizide, Glyburide, Glimepiride) - Meglitinides (Repaglinide, Nateglinide) - Biguanide (Metformin) - $\alpha$ – Glucosidase Inhibitors (Acarbose, Miglitol) - Thiazolidinedione (Pioglitazone, Rosiglitazone) - Incretin Mimetics (Exenatide) - Amylin Analog (Pramlintide) - Insulin (Aspart, Lispro, Glulisine, Glargine, Detemir, NPH)
<b>Monitoring</b>  <b>(Efficacy and Toxicity Parameters)</b>
